1 General Description

This document describes the Copper-Shunt based current sensor demo which utilizes the AS8510 for current measurement and thermal-coefficient compensation.

It is intended for a current range of ~40A operation and 60A maximum. Two measurement paths are provided. The left one uses the AS8510’s internal temperature sensor and the right one uses a fine copper meander trace to sense temperature.

1.1 Kit Content

The kit consists of a four layer PCB with all components mounted on the Top Side. Top and bottom are used for routing of digital signals whereas the inner layers transport the current and act as the measurement shunt resistance.

![Figure 1: AS8510-Copper-Shunt Board](image)

Communication is done via the mini-HDMI Plug on the top side which connects to the USB Interface board and subsequently to the PC via USB.

2 Getting Started

To get started setup the USB Interface Board for 3.3V operation as is explained in the according App-Note. Connect the mini HDMI Plug on the left of this board to the micro HDMI Plug of the USB Interface Board. Connect the load across connectors A-B with A being the GND connection. Install the supplied Software. Connect the USB Interface Board to the PC via USB and start the GUI.

4 Software Description

Figure 3: AS8510 GUI

Once started the PC GUI will automatically detect the AS8510 Board connected to the USB Interface and show this in the right-bottom field.

The Start and Stop buttons will commence measurements respectively stop them.

Measured current and temperature is always displayed synchronous with the temperature in blue and current in red.

The Temp Correction checkbox enables the temperature correction of the impedance of the copper resistor.

In order to get reliable measurement result the sensor has to be calibrated first.

Ideally the board is exposed to a known temperature without current and the Temp Offset is changed until the displayed Temperature is correct.

Then a known low current ~5A is run through the sensor and the I-Scaling is also changed accordingly.

Last but not least the current is run through at a higher temperature and the TK is changed to accommodate for the copper thermal coefficient. All of these values have a rough starting value but will require some tuning for optimal performance.
