TSL250RD, TSL251RD, TSL260RD, TSL261RD
LIGHT-TO-VOLTAGE OPTICAL SENSORS

- Monolithic Silicon IC Containing Photodiode, Operational Amplifier, and Feedback Components
- Converts Light Intensity to a Voltage
- High Irradiance Responsivity, Typically
  - 64 mV/(μW/cm²) at λp = 640 nm (TSL250RD)
  - 58 mV/(μW/cm²) at λp = 940 nm (TSL260RD)
- Single Voltage Supply Operation
- Low Dark (Offset) Voltage . . . 10 mV Max
- Low Supply Current . . . 1.1 mA Typical
- Wide Supply-Voltage Range . . . 2.7 V to 5.5 V
- Low-Profile Surface-Mount Package:
  - Clear Plastic for TSL250RD and TSL251RD
  - Visible Light-Cutoff Filter Plastic for TSL260RD and TSL261RD
- Lead (Pb) Free and RoHS Compliant Package

Description

The TSL250RD, TSL251RD, TSL260RD, and TSL261RD are light-to-voltage optical sensors, each combining a photodiode and a transimpedance amplifier on a single monolithic IC. The TSL250RD and TSL260RD have an equivalent feedback resistance of 16 MΩ and a photodiode measuring 1 square mm. The TSL251RD and TSL261RD have an equivalent feedback resistance of 8 MΩ and a photodiode measuring 0.5 square mm. Output voltage is directly proportional to the light intensity (irradiance) on the photodiode. These devices have improved amplifier offset-voltage stability and low power consumption.

† Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTES: 1. All voltages are with respect to GND.
2. Output may be shorted to supply.
3. The device may be hand soldered provided that heat is applied only to the solder pad and no contact is made between the tip of the solder iron and the device lead. The maximum time heat should be applied to the device is 5 seconds.

NOTES: 4. Measurements are made with $R_L = 10 \text{k}\Omega$ between output and ground.
5. Optical measurements are made using small-angle incident radiation from an LED optical source.
6. The 640 nm input irradiance $E_e$ is supplied by an AlInGaP LED with peak wavelength $\lambda_p = 640 \text{ nm}$.
7. The 940 nm input irradiance $E_e$ is supplied by a GaAs LED with peak wavelength $\lambda_p = 940 \text{ nm}$.
8. Irradiance responsivity is characterized over the range $V_O = V_D$ to 3 V. The best-fit straight line of Output Voltage $V_O$ versus irradiance $E_e$ over this range will typically have a positive extrapolated $V_O$ value for $E_e = 0$.
9. The temperature coefficient of output voltage measurement is made by adjusting irradiance such that $V_O$ is approximately 2 V at 25°C and then with irradiance held constant, measuring $V_O$ while varying the temperature between 0°C and 70°C.

PARAMETER MEASUREMENT INFORMATION

**TEST CIRCUIT**

**VOLTAGE WAVEFORM**

NOTES:
A. The input irradiance is supplied by a pulsed light-emitting diode with $t_r < 1\,\mu\text{s}$, $t_f < 1\,\mu\text{s}$.

B. The output waveform is monitored on an oscilloscope with the following characteristics: $t_f < 100\,\text{ns}$, $Z_i \geq 1\,\text{M}\Omega$, $C_i \leq 20\,\text{pF}$.

APPLICATION INFORMATION

Power Supply Considerations

For optimum device performance, power-supply lines should be decoupled by a 0.01-μF to 0.1-μF capacitor with short leads connected between VDD and GND mounted close to the device package.

Device Operational Details

The voltage developed at the output pin (OUT) is given by:

\[ V_O = V_D + (R_e)(E_e) \]

where:
- \( V_O \) is the output voltage
- \( V_D \) is the output voltage for dark condition (\( E_e = 0 \))
- \( R_e \) is the device responsivity for a given wavelength of light given in mV/(μW/cm²)
- \( E_e \) is the incident irradiance in μW/cm²

\( V_D \) is a fixed offset voltage resulting primarily from the input offset voltage of the internal op amp. As shown in the equation above, this voltage represents a constant, light-independent term in the total output voltage \( V_O \). At low light levels, this offset voltage can be a significant percentage of \( V_O \). For optimum performance of any given device over the full output range, the value of \( V_D \) should be measured (in the absence of light) and later subtracted from all subsequent light measurements (see Figures 2 and 3).

PCB Pad Layout

Suggested PCB pad layout guidelines for the D package is shown in Figure 9.

MANUFACTURING INFORMATION

The Plastic Small Outline IC package (D) has been tested and has demonstrated an ability to be reflow soldered to a PCB substrate.

The solder reflow profile describes the expected maximum heat exposure of components during the solder reflow process of product on a PCB. Temperature is measured on top of component. The component should be limited to a maximum of three passes through this solder reflow profile.

Figure 12. TSL2xxRD Solder Reflow Profile Graph
Moisture Sensitivity

Optical characteristics of the device can be adversely affected during the soldering process by the release and vaporization of moisture that has been previously absorbed into the package molding compound. To prevent these adverse conditions, all devices shipped in carrier tape have been pre-baked and shipped in a sealed moisture-barrier bag. No further action is necessary if these devices are processed through solder reflow within 24 hours of the seal being broken on the moisture-barrier bag.

However, for all devices shipped in tubes or if the seal on the moisture barrier bag has been broken for 24 hours or longer, it is recommended that the following procedures be used to ensure the package molding compound contains the smallest amount of absorbed moisture possible.

For devices shipped in tubes:
1. Remove devices from tubes
2. Bake devices for 4 hours, at 90°C
3. After cooling, load devices back into tubes
4. Perform solder reflow within 24 hours after bake

Bake only a quantity of devices that can be processed through solder reflow in 24 hours. Devices can be re-baked for 4 hours, at 90°C for a cumulative total of 12 hours (3 bakes for 4 hours at 90°C).

For devices shipped in carrier tape:
1. Bake devices for 4 hours, at 90°C in the tape
2. Perform solder reflow within 24 hours after bake

Bake only a quantity of devices that can be processed through solder reflow in 24 hours. Devices can be re-baked for 4 hours in tape, at 90°C for a cumulative total of 12 hours (3 bakes for 4 hours at 90°C).

LEAD-FREE (Pb-FREE) and GREEN STATEMENT

Pb-Free (RoHS)  "TAOS’ terms Lead-Free or Pb-Free mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TAOS Pb-Free products are suitable for use in specified lead-free processes.

Green (RoHS & no Sb/Br)  TAOS defines Green to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material).

Important Information and Disclaimer  The information provided in this statement represents TAOS’ knowledge and belief as of the date that it is provided. TAOS bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties.
